# IAB207: Web Application Development Assignment 3 Report

Group 11: Josh Buckley | Kyle Johnstone | Matilda Teitzel

#### **Members**

- Matilda Teitzel n10470174
- Josh Buckley n10485406
- Kyle Johnstone n9739971

#### Heroku Application

Our Heroku Application can be accessed at: https://iab207-assign2.herokuapp.com/

It should be noted that with the deployment of the application on to heroku, the 'order by latest' feature does not seem compatible with the heroku set up and storage, despite being operational during testing and development using the correct terminology of: order by created date descending. We assume that this is merely a limitation of the Heroku framework, as despite troubleshooting this was unable to work.

It should also be noted that Heroku does not store our images when our code is deployed into the environment, although this does not impact any produces added through the heroku application.

#### GitHub Link

Our Github code can be accessed at <a href="https://github.com/johnstonekyle/IAB207">https://github.com/johnstonekyle/IAB207</a>

#### **Project Management**

The following table illustrates any tasks which were completed over the expanse of the project. This is merely an indication of the rough overview as we primarily utilised the organisational and management structure of Trello to handle and track tasking.

For ease, name initials have been used to identify tasking to specific group members (MT, JB, KJ)

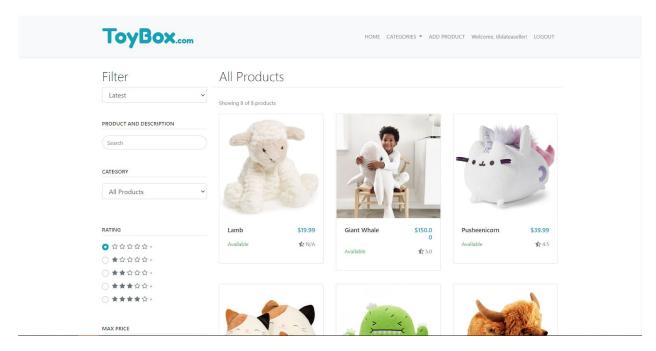

Timeline	•	Week 1	Week 2	Week 3	Week 4
Admin Tasks	%	Conducted a group meeting.	Focus: database and File structure	Focus: Website Functionality	Focus: Finalise Application
Notes		Set up the Readme document	KJ - Set up skeleton code, worked on basic routing		JB & KJ - Deploy Heroku Application
		Decided on "Toy Box" Marketplace			MT - Write Report and Illustrate test
		Setup Github Repository			scripts
		Set up and organise			

	trello content			
Landing Page	KJ - Provided Assignment 2 HTML as Base		MT - Created Landing page of all products MT - Added category Links	MT - added filtering capabilities MT - Added dynamic forms which react to traits of the product (eg price)
User Activity		JB - Added User Functionalities: Registration, Login, Logout	JB - Added Buyer vs Seller Distinction JB - Navigation Validation	JB - Added Buyer vs Seller Page Verification
Create Item			KJ - created the add products page with database functionality	KJ - Added confirmation modal
View product			KJ - Created View Product Page KJ - added comment functionality	MT - Added Dynamic Out of Stock Indicators JB - Added Dynamic Buyer Status Indicator
Ordering			JB - Added Order Product Functionality JB - Added Stock Database Comparisons	KJ & JB - Added Order Receipt
Database Model		KJ - Create sqlite database MT - revise and refine data types within the database model	KJ - Added banking details, comment title	JB - Added data types for phone number and bank details
Error Handling			JB - Error handling for user functionalities MT - Added Out of Stock Indicators	MT - create error 404 page KJ & JB - Error Handling for too much stock orders
Styling			MT - Adjust footer KJ - Added supported file error message	MT & KJ - improve mobile application flexibility

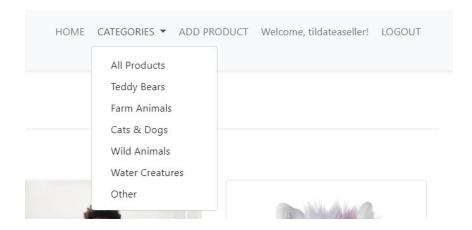

# **Test Script Tasks**

1. The landing page of the application will be accessed. The 'search-by-category' feature that allows a user to view items by category will be tested.

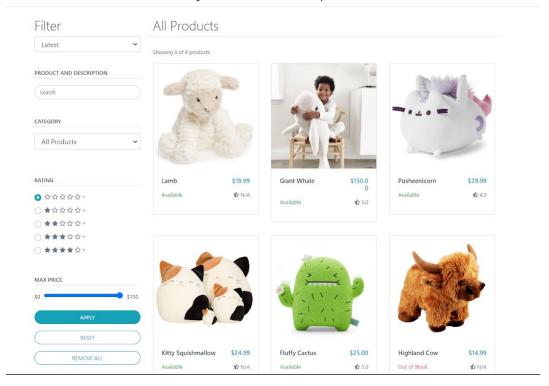

The landing page allows any users' to view the store's products. It defaults to displaying all products without filtering.

Using the navigation bar, a user can select a specific category.

You can also utilise the filtering sidebar for more specific search results as well:

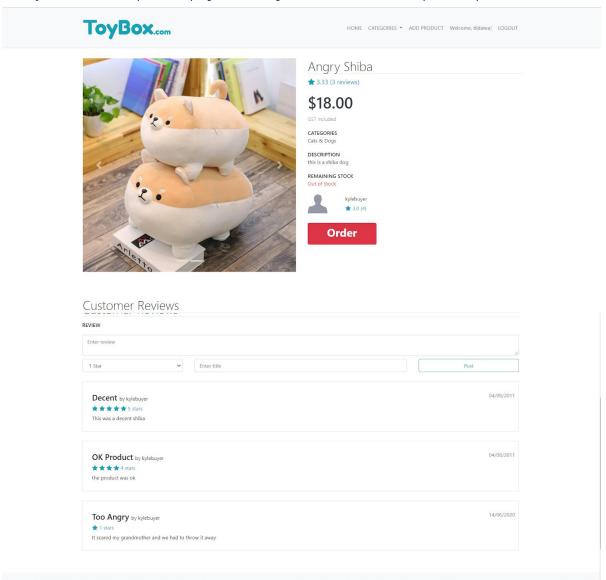

Once a user selects a specific category or variety of filters, the landing page will display the relevant products. It will also indicate how many products it has identified compared to the total number of store products.

2. The details of one of the items on the landing page will be assessed. The user should be able to see the comments posted on the item

Here you can see the product page including the comments on the product post:

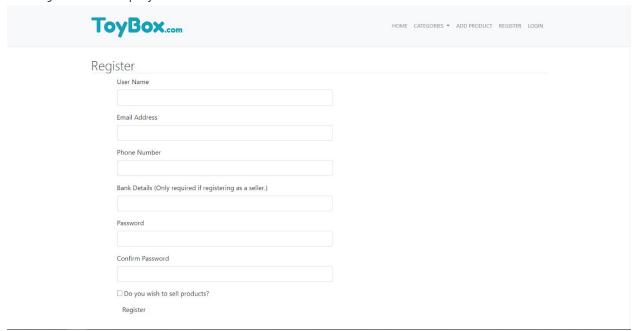

## 3. On trying to create an item, the user should be prompted to a login page.

If a user who is not currently logged in attempts to add a product to the marketplace, they are immediately sent to the following page:

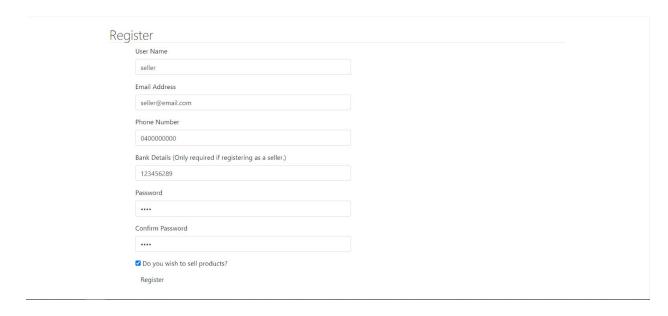

ToyBox.com		HOME CATEGORIES ▼ ADD PRODUCT REGISTER LOGIN
Login		
User Name		
Password		
Login		
New User? Click here to register!		
	© Copyright 2020 ToyBox.com Pty Ltd (ABN 22 145 723 191). All	Rights Reserved.

4. A new user will be registered as a seller and details of the registration page will be tested.

The registration display is as shown.

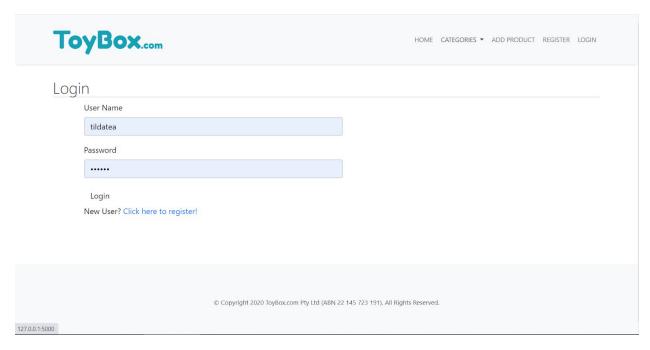

The user is then able to enter their relevant details as a seller:

## 5. The seller will login to the application.

This displays the login process:

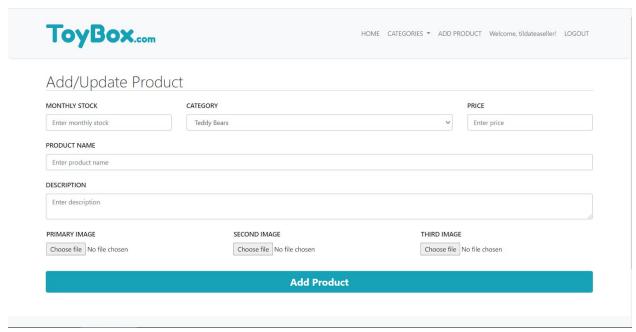

After logging in the navigation bar changes to a personalised format:

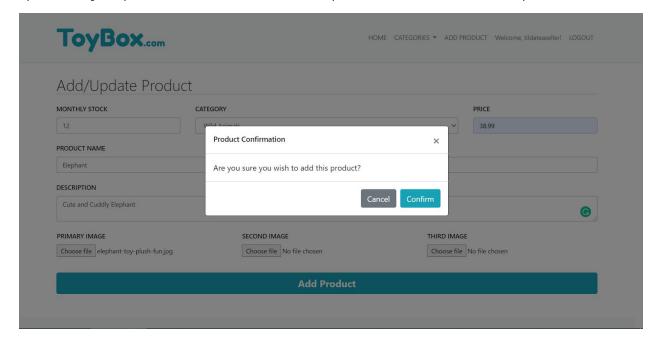

#### 6. The seller will create two items. The item creation will be tested.

Upon pressing the add product button, they view a form to add the product and can promptly fill it out.

Upon adding the product, a confirmation modal is presented to confirm the new product:

Upon pressing confirm, they are then redirected to the new product's view page, as illustrated here:

In this image, the order button is disabled since the user is logged in as a buyer.

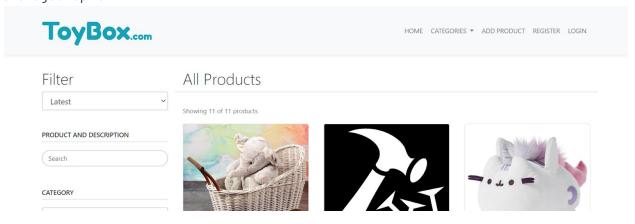

#### 7. The seller will log out of the application. Logout functionality will be tested.

To logout, a buyer or a seller can press the logout button

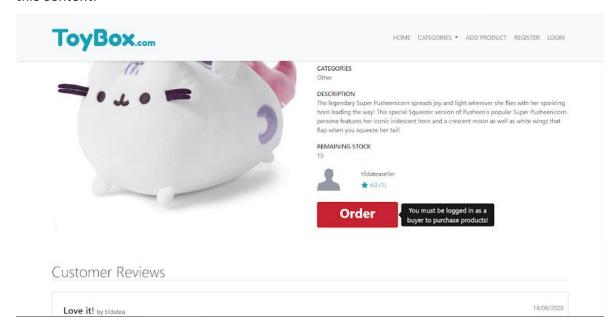

This will immediately logout the user, and take them to the landing page with a login option instead of a logout option.

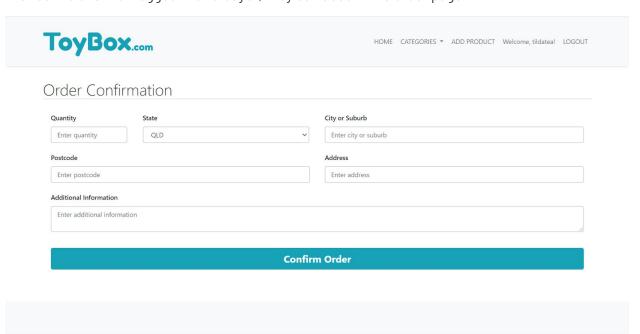

# 8. The 'buy an item' functionality will be tested. A user should be taken to the login page if a user is not logged-in.

After perusing the landing page and selecting a product to view, a potential buyer may press the 'order' button (if the product is still available. If the current user is not logged in as a buyer, the following tooltip and error message will be displayed, indicating the user should login to access this content.

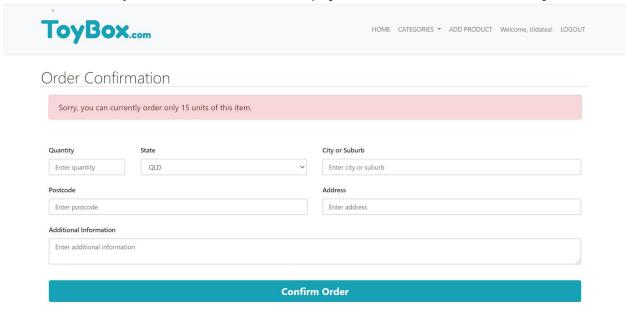

Once the user has logged in as a buyer, they can access the order page:

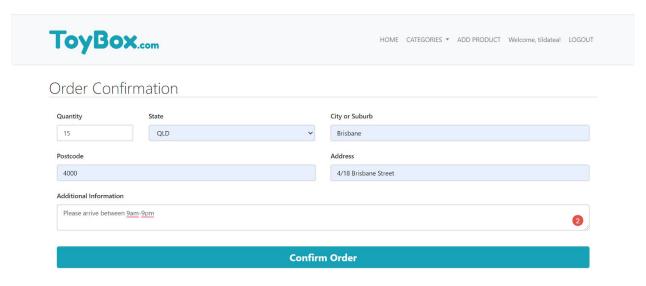

9. The buyer will login and enter a quantity of the item that is higher than the items available in 'stock'. The user will be prompted with an appropriate error message.

If the user completes the order form, and attempts to confirm it with a quantity greater than the available stock, they will be returned to the order page and will receive an error message:

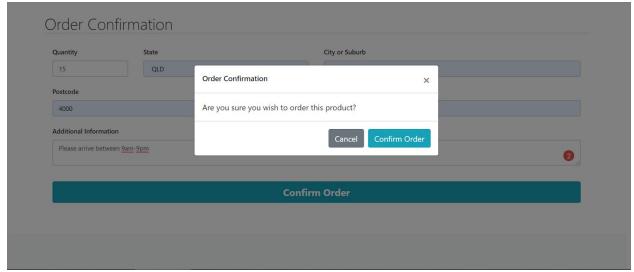

10. The buyer will enter a lower quantity of items. The buyer should be able to order the item by entering relevant details for ordering an item. An order-id will be provided to the buyer.

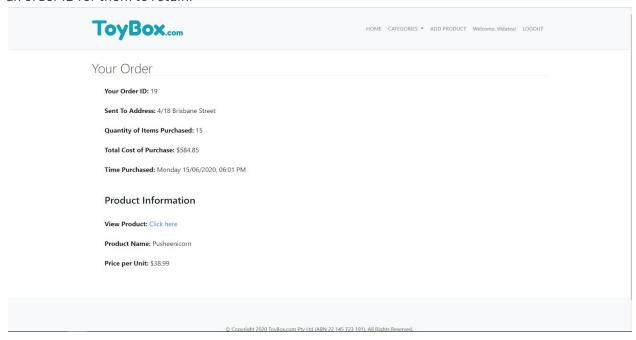

The buyer can lower the quantity of items and complete the order form:

Upon pressing confirm, they will be prompted with a modal which will allow them to confirm their order before proceeding.

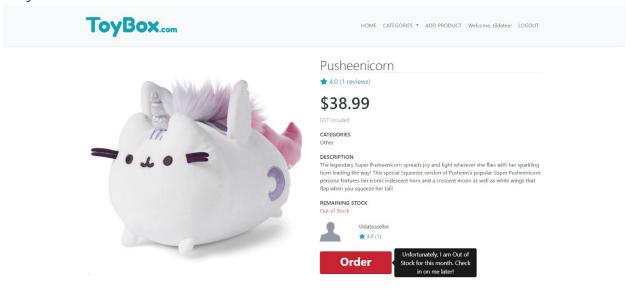

Once the buyer confirms their purchase, they will taken to a docket of their purchase, illustrating an order ID for them to retain.

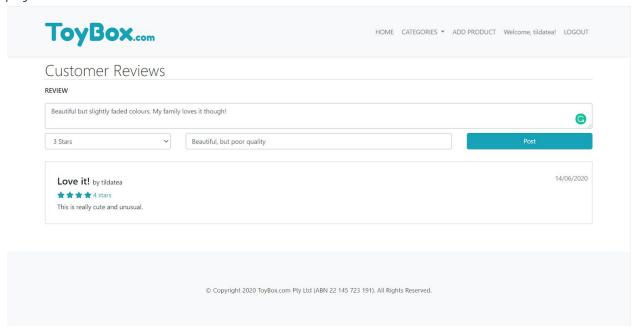

#### 11. The item details should now show 'out-of-stock'

Upon returning to the product listing, the buyer can now see that the product has been completely bought out.

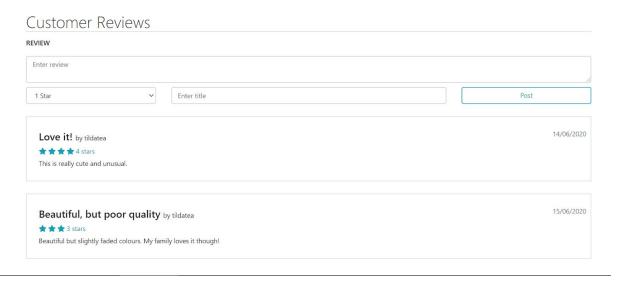

#### 12. The buyer should be able to post comments on the item.

A buyer can provide feedback on products by viewing the Customer Reviews portion of the product page.

Once they press post, they can view their newly added comment on the products page, which they shall remain on.

#### Additional Features of Marketplace

#### 1. Filtering system

To aid potential users in their search of the ideal product, they are able to refine product results by multiple inputs. This improves the basic categorical function. These include:

- Search for specific phrases within the description or name.
- Organise the display of items alphabetically, by most recently released, price low-to-high and price high-to-low
- Search for products of a specific average rating or higher
- Limit the maximum price of products displayed.
- Once again, provides another element to adjust specific category searching

The user is able to update these filters ongoing, reset the current values, or return to the original, standard display of products. This ability also allows users to provide multiple queries, with a display which responsively displays their selected options.
